Three Stage Filtration For Better Water

Stage 1

Sediment

Our first stage features a 1-micron antibacterial sediment pre-filter, offering nearly double the filtering capacity of most products on the market.

This filter effectively removes dirt, sand, clay, mud, algae, silt, rust, and small particulates.

You'll be surprised at the amount of brown and dark brown residue collected after just one year of use—a clear indication of its effectiveness.

Stage 2

Carbon Block

This 0.5 Micron Coconut Carbon Block Filter is highly effective at removing odours, chlorine, cysts, heavy metals, and excess sediment, including lead and materials with high turbidity. It also eliminates volatile organic compounds (VOCs).

By significantly enhancing the overall quality of the water, this filter greatly improves its taste. If you notice a better taste, it's your body communicating that this is much cleaner water.

Stage 3 - option 1

Gac & Heavy Metals

Our GAC filter reduces chlorine, heavy metals, and hydrogen sulphide, enhancing water taste and quality for household and commercial use. It effectively removes taste- and odour-producing compounds, VOCs, synthetic organic compounds, and disinfection byproduct precursors, as well as PFAS, chlorine, and fluoride.

This filter is an excellent choice for human consumption.

Stage 3 - option 2

Anti Scale (4th Option in UF-4X)

Our water treatment media is an economical and reliable solution for preventing limescale in both potable and industrial water applications.

It acts as a sequestering agent, coating minerals that contribute to limescale, making them less sticky and allowing them to remain suspended in the water.

The media is FDA-approved and considered safe for drinking water.

Warranty & Technical Specification

Warranty

We stand behind our product, where industry standard offers 1-2 years warranty.

On the UF-3X Urban Future offers a full 5 year comprehensive warranty which includes replacement and workmanship on filter housing, manifold and sleeves.
